

AMENDMENTS TO THE CLAIMS:

Complete Listing of Claims

Claims 1-12 (canceled)

Claim 13 (original) A method of assembling a flip chip semiconductor device having a polymeric adhesive mechanically bonding a substrate to chip, and filling the space between contacts including the following steps:

dispensing a controlled amount of a thermosetting adhesive paste onto a patterned substrate,

aligning a chip having protruding contact terminals to mating contact pads on said substrate,

thermal compression bonding the contact terminals,

exposing the back surface of the chip to infrared radiation, whereby heat generated causes said adhesive to flow between the surfaces of substrate and chip, to surround the contact terminals, and subsequently to solidify, and adhere the assemblage, and

controlling the ramp and duration time, and the intensity of infrared exposure by a computer input.

Claim 14 (original) A method for assembling a flip chip device as in claim 13 wherein bonding of said terminals is by thermosonic bonding.

Claim 15 (original) A method for assembling a flip chip device as in claim 13 wherein the time for adhesive to flow between the chip and substrate and to solidify is equal to or less than the time for aligning and bonding terminals.

Claim 16 (original) A reel to reel method for assembling a plurality of flip chip semiconductor devices including the following steps:

feeding patterned flexible tape stepwise from a reel onto a work station;
depositing a rapidly curing thermosetting adhesive is deposited on a specified area of the tape for each device,

feeding the tape to the next work station; aligning a semiconductor chip having protruding contact terminals to mating contact pads on said substrate; and binding the terminals by thermal compression bonding;

indexing the tape to a work station having an infrared radiation source; exposing the back surface of said chip to said infrared radiation whereby the generated heat causes said adhesive to flow between the surfaces of substrate and chip, surrounding the contact terminals, and subsequently solidifying to adhere the assemblage; and

winding the tape with assembled devices onto a take up reel.

Claim 17 (original) A method as in claim 16 wherein the duration of infrared exposure is less than the alignment and bonding time.

Claim 18 (original) A method as in claim 16 wherein the terminals are bonded by thermo-sonic bonding.

Claim 19. (canceled)
